

23 YO M

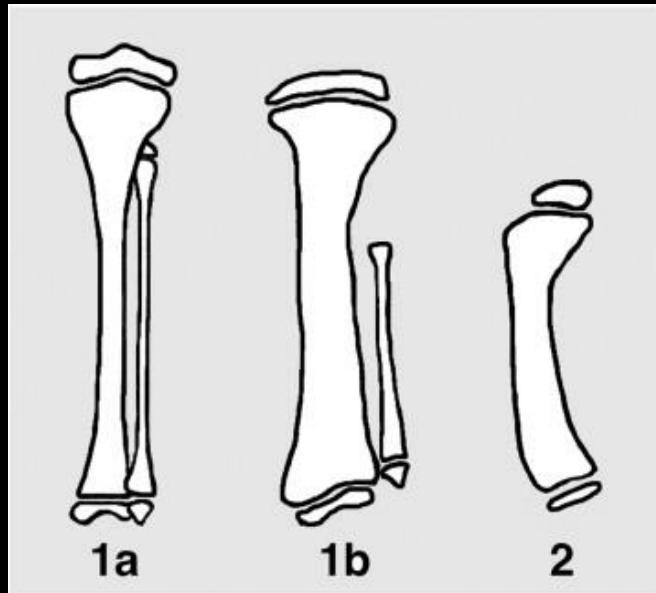

# Fibular hemimelia

- Congenital longitudinal deficiency of the fibula
- Most common congenital lower extremity deficiency
- First described in 1698 by Gollier
- Most often unilateral
- Wide spectrum of abnormalities involving lower extremity
- Males affected 2:1
- Can occur sporadically or in association with other congenital anomalies

# Classification

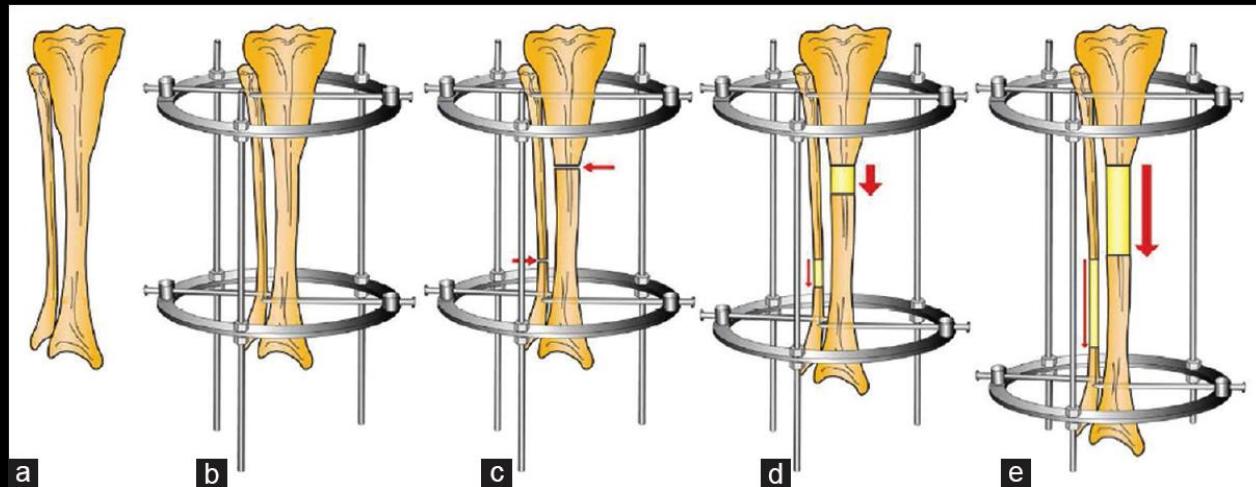

Achterman and Kalamchi

1. Type I: minimal hypoplasia of the fibula
2. Type II: complete absence of the fibula

# Treatment

- Shoe lift
- Brace
- Limb lengthening

# Internal derangements

- Distal femoral dysplasia
- Convexity of proximal tibial epiphysis with hypoplastic or absent tibial spines
- Genu valgum
- Tibial bowing
- Hypoplastic or absent ACL/PCL
- Menisci
- Posterolateral corner
